The art of clean combustion

Oilon is an international energy technology company whose products support sustainable development by directly and measurably reducing emissions. Oilon's goal is to promote sustainable development and set a good example in the fight against climate change. As a 60-year-old family business, we find it important to preserve nature for future generations as well.

Oilon is a pioneer in first-rate low emission burner technology. Our selection of burners supports the transition to even cleaner and renewable fuels.

The excellent performance and reliability as well as the low emissions of Oilon burners are the result of decades of experience and long development. Depending on the solution, our burners can achieve the most stringent emission requirements in the world. Additionally, we provide combustion solutions for hydrogen, biogases, bio-oils, and other renewable fuels.

We have wide-ranging experience in firing different liquid and gaseous fuels. Thanks to our global dealer network, local presence on five continents, and extensive product approval and certification, we can offer burners and combustion technology to different customers and a wide range of applications across the globe.

Our modern research and development center in Lahti, Finland is equipped with the latest technology for combustion research, testing and data collection. In addition to testing, we simulate combustion processes with computational fluid dynamics (CFD) modeling.

We are especially committed to reducing nitrogen oxide (NO_x) and particulate emissions.

Oilon Burners

Oilon gas, oil, and dual fuel burners are fully automatic, safe, and reliable. The burners are equipped with the latest digital technology.

Design

Oilon burners are designed for easy operation and maintenance with a particular focus on safety and minimizing environmental loads.

Applications

Oilon burners are suitable for various applications, such as hot water boilers, steam boilers, air heaters and different process applications.

Fuels

Oilon burners are suitable for various liquid and gaseous fuels. Examples of suitable fuels include light fuel oil and heavy fuel oil (with a viscosity up to 700 mm²/s at 50 °C) as well as natural gas and LPG (2nd family gases, groups H and E). Burners using other fuels are available on request.

Connectivity

Digital combustion management enables communication with external systems. Remote monitoring and diagnostics optimize operational efficiency.

Standards

Oilon gas burners are compliant with the EN 676 standard, oil burners with the EN 298 and EN 267 standard, and dual fuel burners with each of the above. The burners are EU type tested. Additionally, we offer burners that are compliant with marine classification society requirements, such as ABS, BV, CCS, DNV, GL, KR, LR, NKK, RINA, and RS.

An Oilon burner is your choice!

Choosing the burner

A. Procedure

1. Determine the technical details of the boiler and the application:
 - boiler capacity and efficiency, or the required burner capacity
 - furnace back pressure
 - fuel/fuels to be used
 - burner inlet fuel pressure
 - burner capacity control method
2. Calculate the burner capacity. Burner capacity = boiler capacity / efficiency
 Example: boiler capacity 2,500 kW, efficiency 90% → burner capacity = 2,500 kW / 0.9 = 2,780 kW
3. Gas burners: Required gas flow [m³n/h] = (burner capacity [kW] x 3.6) / calorific value of the gas [MJ/m³n].
 Example: required burner capacity = 2,780 kW → required gas flow = (2,780 kW x 3.6) / 35.8 MJ/m³n = 280 m³n/h, where 35.8 MJ/m³n is the calorific value of natural gas.
 Oil burners: Calculate the required oil flow [kg/h]. Required oil flow [kg/h] = (burner capacity [kW] x 3.6) / calorific value of the oil [MJ/kg]. Example: required burner capacity = 2,780 kW → required oil flow = (2,780 kW x 3.6) / 42.7 MJ/kg = 234 kg/h, where 42.7 MJ/kg is the calorific value of light oil.
4. Check the burner's operating range from working diagrams. The curves indicate the operating range for different burners. For example, at a 2,780 kW burner capacity, the boiler backpressure is 12 mbar. In the diagram, mark the required burner capacity on the horizontal axis. Mark the boiler's backpressure on the vertical axis. The point where the two lines meet determines the required burner type. For optimal performance, select a burner whose operating point is as close to the right edge of the curve as possible. Note that different fuels and capacity control methods require separate graphs.
5. Valve selection for gas and dual fuel burners: Select a suitable valve from the gas valve selection table. Note that the values in the valve selection table apply when the furnace back pressure is 0 mbar. Subtract the furnace back pressure from the actual gas inlet pressure and choose the valve based on this value. The ratings shown in the table apply to natural gas.
 Example: The gas inlet pressure of 70 mbar, the boiler backpressure 12 mbar, and the required burner capacity is 2,780 kW. Consequently, the effective pressure is 70 mbar - 12 mbar = 58 mbar. For a GP-280 M burner, for example, you need to choose a valve that provides a minimum burner capacity of 2,780 kW when the gas inlet pressure is 58 mbar → valve DN 65.
6. Check that the outer dimensions of the burner are suitable for the application. Pay special attention to combustion head length.
7. Check the flame dimensions from the flame dimension table. Make sure that the flame does not come into contact with the walls of the furnace. When selecting a modulating light fuel oil burner without a deaerator, the capacity of the supply pumping unit must be at least equal to the burner's atomizing pump capacity +15%.
8. Consider the impact of optional equipment, such as the gas pressure regulator and oil pumping unit as well as boiler thermostats/pressostats.

B. Equations and rules of thumb

1. Burner capacity = boiler capacity / 0.9 (when boiler efficiency is 90%)
2. Steam boilers: 1 tonne/h steam ≈ 700 kW boiler capacity
3. Light oil: 1 kg/h ≈ 11.86 kW burner capacity with calorific value 42.7 MJ/kg
4. Heavy oil: 1 kg/h ≈ 11.22 kW burner capacity with calorific value 40.5 MJ/kg
5. Natural gas: 1 m³n/h ≈ 10 kW burner capacity with calorific value 35.84 MJ/m³n
6. The amount of combustion air:
 - Gas burners: 12–13 m³/h per 10 kW of burner capacity.
 - Oil burners: 13.5 m³/h per kg of oil burned [kg/h].
7. An oil pumping, filtering, and preheating unit is required for heavy fuel oil. The required minimum pump output [kg/h] can be calculated as follows:
 Required minimum output [kg/h] = (oil flow to be burned in kg/h + 150 to 200 kg/h) * 1.25 to 1.3. The expression inside the parentheses indicates the preheated oil flow to each burner.

An example of burner selection

Boiler pressure loss as a function of burner capacity.

The max. capacity of a hot water boiler is 2,500 kW, efficiency 0.9, and the corresponding burner capacity 2,500 kW / 0.9 = 2,780 kW. The diagram indicates that GP-280 M corresponds to the required capacity, as the pressure loss value for the boiler is inside the burner's operating envelope. GP-250 M can also be used for this application, provided that the full boiler capacity is not required. Remember to take efficiency into account when relating the boiler pressure loss information to the burner working diagram.

NOx emissions

Nitrogen oxides (NOx) are compounds of nitrogen and oxygen, the most important of which are NO and NO₂. Small amounts of nitrogen oxides also occur in nature, but the majority of them originate from human actions, mainly from logistics and energy production.

Nitrogen oxides are formed in all combustion processes when the nitrogen in the fuel or combustion air and the oxygen in the combustion air react at high temperatures.

Nitrogen oxides are harmful to humans and the environment in many ways. They are toxic and harmful to the respiratory system. Nitrogen oxides cause acidification and eutrophication of the environment, and they form ground-level ozone and harmful particulate emissions.

Governments around the world impose increasingly stringent emission limits to mitigate the adverse effects of nitrogen oxide emissions. Reducing nitrogen oxides is the key priority in lowering emissions from traffic and energy production.

We are especially committed to reducing nitrogen oxide (NOx) and particulate emissions. One of our most important goals when developing our products is to lower emission levels.

Effect of combustion head on NOx emissions, natural gas

Oilon Low-NOx natural gas burners (80 mg/kWh) meet the requirements of emission class 3 (EN 676). 60 mg/kWh natural gas burners meet the requirements of emission class 4 (EN676).

Our burners achieve low NOx emissions thanks to innovative gas and air distribution and staging in the combustion head.

Another method we use to reduce NOx emissions is internal or external flue gas recirculation, which reduces flame peak temperatures and slows down the rate of reaction during combustion. Emission values depend on the furnace geometry, the furnace load and the temperature of the boiler medium. Low NOx levels are mainly achieved in standard 2- or 3-pass boilers.

The maximum allowed NOx levels for burners are shown in the table below. The table applies to burners designed for firing 2nd or 3rd family gases or light fuel oil.

Class	NOx emissions in standard conditions, mg/kWh		
	Gas (EN676)		LFO (EN267)
	2nd family groups H, E and L	3rd family	–
1	≤ 170	≤ 230	≤ 250
2	≤ 120	≤ 180	≤ 185
3	≤ 80	≤ 140	≤ 120
4	≤ 60	≤ 110	–

Note that the NOx value calculated for 2nd family gases shall not exceed 170 mg/kWh. For 3rd family gases, the maximum limit is 230 mg/kWh.

FGR – flue gas recirculation

External flue gas recirculation, FGR, is an effective low-cost solution to achieve very low NO_x emissions with various fuels.

A certain proportion of flue gas is led back to the furnace through the burner. This reduces peak temperatures in the flame and slows down combustion reactions, reducing NO_x emissions.

Achievable reduction depends on many factors, including burner type, boiler, combustion air temperature, and the amount of flue gas being recirculated (see the diagram). When designing the assembly, it is important to note that flue gas recirculation reduces the burner's maximum output depending on the FGR rate and flue gas temperature.

Flue gas recirculation is available as an option for new burners, or in many cases, as a retrofit to an existing burner.

The effect of FGR in natural gas combustion

Gas mixture temperature in FGR, standard application

The diagram is valid when combustion air temperature is +30 °C.

An Oilon burner in an FGR application

Minimum required components:

- WD200 burner control system
- Flue gas damper with servomotor
- Flue gas inlet adapter
- Recirculation pipe (in customer scope)

1. O₂ sensor (option)
2. User interface
3. Control unit
4. Gas damper
5. Air damper
6. Flue gas damper
7. Temperature sensor
8. Recirculation pipe

Check burner-specific automation options on each burner's technical data page.

Oilon WiseDrive – High efficiency with advanced automation

Oilon WiseDrive is an electronic fuel/air ratio control system. In the WiseDrive system, combustion air dampers and control valves have their own actuators. The system can be expanded with additional actuators for combustion head control (to control air flow in the combustion head). The ratio between fuel, combustion air, and combustion head air flow is adjusted electronically. Additionally, the WiseDrive system takes care of burner control and safety functions.

High efficiency

Electronic fuel/air ratio control improves combustion efficiency and lowers emissions. The greatest benefits are achieved in dual fuel burners where the combustion of both the main and reserve fuel can be optimized through adjustment, especially when O₂ control is in use. Additionally, significant energy savings can be achieved by fitting a variable speed drive (VSD) for the combustion air fan.

A versatile system

The Oilon WiseDrive system can be connected to external systems via fieldbus connection. Data regarding burner status and combustion process can be read remotely. Additionally, the system supports remote control (start, stop, reset) and setting configuration (capacity controller, fuel selection) through a fieldbus.

WiseDrive (WD) electronic regulator for controlling the fuel/air ratio – an energy-efficient and environmentally friendly solution

Electronic fuel/air ratio control lowers flue gas emissions, decreases energy consumption, and improves the technical characteristics of the burner through more accurate regulation.

The WiseDrive system provides control sequences, fuel/air ratio and capacity control, gas valve leak testing, and much more in a single package.

Example of Oilon WiseDrive WD34 + variable speed drive

Examples of WiseDrive functions:

- Control sequences and safety functions
- Fuel/air ratio control
- Load control with built-in PID controller, support for control with an external 4–20 mA signal
- Can be connected to external plant automation via bus (option)
- Different access levels
- Parameter input via operating panel with text display or using a PC (check software and hardware requirements)

Example of cost savings using O₂ control

Example values

– Boiler capacity	5 MW
– Average operating time	4,000 h/year
– Average capacity	60%
– Price of light fuel oil	0.55 €/l
– Price of natural gas	0.30 €/m ³ n
– Price of electricity	0.10 €/kWh

1. The effect of O₂ control on combustion efficiency

In a traditional burner, the O₂ level of flue gases is usually adjusted to about 4%. When using WD200, a 2% O₂ level can be reached. A two per cent reduction in O₂ level increases efficiency by 1%.

Resulting annual savings:

- EUR 6,550 with light fuel oil
- EUR 3,600 with natural gas

2. Reduced power consumption with burner motor speed control

Burner without a VSD:

- Electricity consumption 31,600 kWh/year
- Cost EUR 3,160

Burner equipped with a VSD:

- Electricity consumption 9,600 kWh/year
- Cost EUR 960

Annual savings: EUR 3,160 – EUR 960 = EUR 2,200

3. When using both O₂ control and fan motor speed control, the annual savings are:

- EUR 8,750 with light fuel oil
- EUR 5,800 with natural gas

Motor power consumption, 5 MW burner

Noise level with VSD and without VSD

Scope of delivery, RP-130 - 700

	130 - 280	300 - 700
Hinge flange with limit switch	•	•
Burner flange gasket	•	•
WiseDrive (electronic ratio control) *	•	•
Ignition transformer	•	•
Ignition cables and electrodes	•	•
Flame detector: – WDX00/QRI (continuous operation)	•	•
Built-in combustion air fan	•	•
Air damper with servomotor	•	•
Combustion head optimizer with servomotor, WDX00	–	•
Oil nozzle	•	•
Solenoid valves for oil	•	•
Oil pump with pressure regulation valve	•	•
Oil regulating valve with servomotor	•	•
Separate motor for oil pump	–	•
Non-return valve	•	•
Pressure gauge or gauges for oil	•	•
Pressure switch for return oil	•	•
2 oil hoses, 2,000 mm	•	•
Oil filter	•	•
Deaerator for oil	•	•
Heating cartridge for solenoid valve	•	•
Thermometer	•	•
Electric preheater incl: limit thermostat, temperature sensor	•	•
Operation and maintenance manual	•	•

• Standard

* For more information, see chapter Oilon WiseDrive.

Optional equipment:

	130 - 280	300 - 700
Fan pressure gauge	•	•
Continuous operation, WD3x	–	–
VSD equipment	•	•
Extended combustion head	•	•
Pressure gauge for monitoring of inlet oil pressure	•	•
Pressure switch for monitoring of inlet oil pressure	•	•
Oil pressure (nozzle and return) transmitter	•	•
Oil temperature (nozzle and return) transmitter	•	•

Options:

	130 - 280	300 - 700
Heating cartridge for oil nozzle and oil pump	•	•
Electric trace heating for oil pipeline	•	•
Electric trace heating for oil hoses	•	•

Working diagram

Scope of delivery, GRP-130 - 700

	130 - 280	300 - 700
Hinge flange with limit switch	•	•
Burner flange gasket	•	•
WiseDrive (electronic ratio control) *	•	•
Ignition transformer	•	•
Ignition cables and electrodes	•	•
Flame detector: – WDX00/QRI (continuous operation)	•	•
Built-in combustion air fan	•	•
Air damper with servomotor	•	•
Combustion head optimizer with servomotor, WDX00	–	•
Gas damper with servomotor	•	•
Gas nozzle	•	•
Connection for measuring the pressure in gas nozzle	•	•
Gas pressure switch, max.	•	•
Differential air pressure switch	•	•
Gas elbow, 90°	•	•
Double solenoid valve for gas	•	•
Pressure regulation valve for gas: – DMV valve – VGD valve	– •	– •
Ignition gas valve and piping	–	•
Pressure switch for gas, min.	•	•
Automatic valve leak testing for gas	•	•
Oil nozzle	•	•
Solenoid valves for oil	•	•
Oil pump with pressure regulation valve	•	•
Oil regulating valve with servomotor	•	•
Separate motor for oil pump	•	•
Non-return valve	•	•
Pressure gauge or gauges for oil	•	•
Pressure switch for return oil	•	•
2 oil hoses, 2,000 mm	•	•
Oil filter	•	•
Deaerator for oil	•	•
Heating cartridge for solenoid valve	•	•
Thermometer	•	•
Electric preheater incl: limit thermostat, temperature sensor	•	•
Operation and maintenance manual	•	•

• Standard

* For more information, see chapter Oilon WiseDrive.

Optional equipment:

	130 - 280	300 - 700
Fan pressure gauge	•	•
Continuous operation, WD3x	—	—
VSD equipment	•	•
Extended combustion head	•	•
Ignition gas valve and piping	•	—
Gas pressure gauge	•	•
LPG gas nozzle	•	•
Pressure gauge for monitoring of inlet oil pressure	•	•
Pressure switch for monitoring of inlet oil pressure	•	•
Oil pressure (nozzle and return) transmitter	•	•
Oil temperature (nozzle and return) transmitter	•	•

Options:

	130 - 280	300 - 700
Heating cartridge for oil nozzle and oil pump	•	•
Electric trace heating for oil pipeline	•	•
Electric trace heating for oil hoses	•	•

PI diagrams

GAS, MB-ZRDLE, H BURNERS

1. Gas valve
 - filter
 - pressure switch min.
 - main gas valve
 - pressure regulator
 - gas valve, 2-stage
2. Valve leak tester (burner capacity > 1200 kW)
3. Solenoid valve, ignition gas, on request
7. Air damper
8. Servomotor
9. Combustion air fan
10. Electric motor
11. Differential air pressure switch
12. Flame detector

A = Gas supply
B = Air supply

GAS, VGD VALVE, M BURNERS

1. Double solenoid valve
 - 1.1 Solenoid valve
 - 1.2 Pressure regulating valve
2. Pressure switch
 - 2.1 Pressure switch (only in WDx00 burners)
 - 2.2 Pressure switch (in WDx00 and WD3x burners)
3. Gas butterfly valve
4. Servomotor
5. Pressure switch, max. (Not standard with 50/90 burners)
6. Solenoid valve, ignition gas,
* depends on the burner type
7. Air damper
8. Servomotor
9. Combustion air fan
10. Electric motor
11. Differential air pressure switch
12. Flame detector

A = Gas supply
B = Air supply

GAS, VGD VALVE, M LN30 BURNERS

- 1. Double solenoid valve
- 1.1 Solenoid valve
- 1.2 Pressure regulating valve
- 2. Pressure switch
- 2.1 Pressure switch (only in WDX00 burners)
- 2.2 Pressure switch (in WDX00 and WDX3x burners)
- 3. Gas butterfly valve, main gas
- 4. Servomotor, main gas
- 5. Pressure switch, max., main gas
- 6. Gas butterfly valve, primary gas
- 7. Servomotor, primary gas
- 10. Air damper
- 11. Servomotor
- 12. Combustion air fan
- 13. Electric motor
- 14. Differential air pressure switch
- 15. Flame detector

A = Gas supply
B = Air supply

GAS, VGD VALVE, M LN60 BURNERS

- 1. Double solenoid valve
- 1.1 Solenoid valve
- 1.2 Pressure regulating valve
- 2. Pressure switch
- 2.1 Pressure switch (burner type WDX00)
- 2.2 Pressure switch (in WDX00 and WDX3x burners)
- 3. Gas butterfly valve, primary gas
- 4. Servomotor, primary gas
- 5. Pressure switch, max, primary gas
- 6. Gas butterfly valve, tertiary gas
- 7. Servomotor, tertiary gas
- 8. Pressure switch, max, tertiary gas
- 14. Air damper
- 15. Servomotor
- 16. Combustion air fan
- 17. Electric motor
- 18. Differential air pressure switch
- 19. Flame detector
- 20. Flame detector

A = Gas supply
B = Air supply

LIGHT FUEL OIL, H BURNERS

1. Oil hose, loose delivery
2. Oil filter, loose delivery
3. Oil pump
4. Solenoid valve, NC
5. Solenoid valve, NC
6. Solenoid valve, NC
14. Air damper
15. Servomotor
16. Combustion air fan
17. Electric motor
18. Differential air pressure switch, not for KP-50 - 150 H burners
19. Flame detector

A = Oil supply 0–5 bar

B = Oil return

C = Air supply

LIGHT FUEL OIL, M BURNER SERIES 140 - 700

1. Oil hose, loose delivery
2. Oil filter, loose delivery
3. Oil pump
- 3.1 Oil pump
- 3.2 Oil regulating valve
4. Electric motor
5. Pressure gauge
6. Solenoid valve 1, NC (115 V)
7. Solenoid valve 2, NC (115 V)
8. Pressure gauge
9. Oil regulator valve
10. Servomotor
11. Pressure switch
12. Solenoid valve 1, NC (115 V)
13. Solenoid valve 2, NC (115 V)
14. Air damper
15. Servomotor
16. Combustion air fan
17. Electric motor
18. Differential air pressure switch, not for KP-130 - 280 M burners
19. Flame detector

A = Oil supply 0–5 bar

B = Oil return

C = Air supply

LIGHT FUEL OIL, M BURNER SERIES 1000/1200

1. Pressure gauge
2. Solenoid valve, NC (115 V)
3. Solenoid valve, NC (115 V)
4. Throttle plug
5. Solenoid valve, ignition oil, NC
6. Solenoid valve, ignition oil, NC
7. Pressure gauge
8. Servomotor
9. Oil regulator valve
10. Pressure switch
11. Solenoid valve 1, NC (115 V)
12. Solenoid valve 2, NC (115 V)
13. Needle valve
14. Pressure gauge
20. Air damper
21. Servomotor
22. Combustion air fan
23. Electric motor
24. Differential air pressure switch
25. Flame detector

A = Oil supply

B = Oil return

C = Air supply

HEAVY FUEL OIL, M BURNER SERIES 130 - 280

1. Oil filter, loose delivery
2. Oil hose, loose delivery
3. Oil pump, plugged
4. Electric motor
5. Pressure gauge
6. Preheater
7. Temperature regulation / lower limit
8. Limit thermostat
9. Thermometer
10. Solenoid valve, NC
11. Solenoid valve, NC
12. Solenoid valve, NO
13. Pressure gauge
14. Oil regulator valve
15. Servomotor
16. Non-return valve
17. Pressure switch, max.
18. Deaerator
19. Drilled ball valve
20. Air damper
21. Servomotor
22. Combustion air fan
23. Electric motor
24. Differential air pressure switch (not for RP models)
25. Flame detector

HEAVY FUEL OIL, M BURNER SERIES 300 - 700

A = Oil supply
B = Oil return
C = Air supply

1. Oil filter, loose delivery
2. Oil hose, loose delivery
3. Oil pump, plugged
4. Electric motor
5. Pressure gauge
6. Preheater
7. Temperature regulation, lower limit
8. Limit thermostat
9. Thermometer
10. Solenoid valve, NC
11. Solenoid valve, NC
12. Solenoid valve, NO
13. Pressure gauge
14. Oil regulator valve
15. Servomotor
16. Non-return valve
17. Pressure switch, max.
18. Deaerator
19. Drilled ball valve
20. Air damper
21. Servomotor
22. Combustion air fan
23. Electric motor
24. Differential air pressure switch
25. Flame detector

A = Oil supply
B = Oil return
C = Air supply

Dimensions in mm.

D_7 minimum $\geq D_6 * 0.7$

L_6 is the overall boiler front wall thickness, including refractory, steel front wall, and burner mounting plate (if present).

* For hot water boiler (medium temperature max. +130 °C).

** For steam boiler (medium temperature max +210 °C).

*** If the diameter is very wide, a longer furnace may be required.

Fuels: Natural gas, 2nd family gases, groups H and E (equipment category I_{2R}).

Hood silencer

Air intake silencer

Construction

The silencer is made of steel sheet lined with fireproof dampening wool. It connects to the burner's suction side via a screw connection. The silencer reduces the high-pitched noise produced by air flow.

Burner	W	L	H
80/90	320	320	160
130 - 150	427	392	230
250/280	427	392	230
300	530	610	290
700	560	722	330
1000/1200	525	800	665

Dimensions in mm.

Hood silencer

Construction

The silencer is made of steel sheet lined with fireproof dampening wool. This wheel-equipped silencer isolates the burner from four sides, reducing the burner's operating noise. The product is delivered in parts (steel sheet components).

Burner	W	L	H
130 - 280	1330	1525	1425 - 1935
300 - 700	1670	1845	1910 - 2420
1000/1200	2210	1970	2485 - 2995

Booster unit

The booster unit is used for pumping light fuel oil with a viscosity of 4–12 mm²/s at +20 °C. The oil supplied to the booster unit must be filtered, max. filtration degree: 150 µm.

- 1. Oil filter
- 2. Pressure gauge
- 3. Oil pump
- 4. Electric motor
- 5. Pressure regulating valve
- 6. Drilled ball valve

- A. Inlet to the booster unit DN25, 1 - 5 bar, 4 - 12 mm²/s
- B. Return from the booster unit R1/2"
- C. Inlet to the burner Ø 22
- D. Return from the burner Ø 22

Dimensions in mm.

Booster unit	Motor 400 V/50 Hz		Oil pump	Pump output
	kW	rpm	Type	12 mm ² /s, 25 bar kg/h
PKYK 2	4	3000	T4 C	1980
PKYK 3	4	3000	T5 C	2900

The output has been calculated using a density of 850 kg/m³ for light fuel oil.

Commissioning and maintenance services

We have extensive expertise in burner technology and processes. We offer reliable commissioning, maintenance, and training services for all needs. Our team will help you design a system that will meet the requirements of environmental rules and regulations and operate at optimal efficiency.

Technical support

The technical support service is intended for retailers, maintenance companies, and end customers. You can contact us with any questions about technical problems or warranty issues. We also design and implement updates for your burner systems with full expertise.

Spare part services

Our spare part service will support the customer throughout the product's life cycle.

- spare part recommendations for both new and old systems
- spare parts for servicing and maintenance

Spare parts store

Service partners and dealers can order spare parts directly from our webshop. Contact our spare part sales team for the required login details.

Visit our spare parts webshop at
<http://webshop.oilon.com>

Modern training facilities

We provide high-level training for our products, and the goal of our product training is to improve the professional competence of installation and maintenance companies.

Our theoretical sessions focus on key considerations for our burners' operating environment and components. Practical exercises include burner adjustment and fault diagnostics, among many other things. We also underline the importance of low emission values for the environment.

Our Sales and Service Network

118

During our extensive years of operation, we have evolved from a small traditional burner manufacturer into a global well-known energy and environmental technology company.

Our strong commitment to research and development has resulted in growing staff know-how and a rapid increase in the product range.

We have production facilities and sales offices in Finland, USA, Brazil, and China and resellers all over the world.
